REST API reference	3016
Glossary	3017
Frequently asked questions	3019

About this reference

Summary: This Reference section contains the commands and their syntax for all the command line tools in ThoughtSpot.

Included in this guide are:

- [Keyword reference \[See page 3\]](#) lists the available keywords to use in your search.
- [Formula function reference \[See page 30\]](#) lists the available formula operators and functions. These are also listed in the Formula Assistant, which is available from the place in ThoughtSpot where you build formulas.
- [Date and time formats reference \[See page 12\]](#) lists the accepted date, time, and timestamp formats that you can use when uploading data through the Web interface or using the ThoughtSpot Loader.
- [Row level security rules reference \[See page 16\]](#) lists the operators for building row level security rules.

Keyword reference

Summary: Use keywords to help define a search.

You can use keywords when asking a question to help define your search. This reference lists the various keywords.

Keywords in Other Languages

Currently, we offer the following keyword translations.

日本語 [See page 0]	中文 (简体) [See page 0]	Deutsche [See page 0]	Español (Latinoamérica) [See page 0]	Español (España) [See page 0]
Français (Canada) [See page 0]	Français (France) [See page 0]	Português (Brasil) [See page 0]	Português (Portugal) [See page 0]	Italiano [See page 0]
Dansk [See page 0]	Suomi [See page 0]	Svenska [See page 0]	Norsk [See page 0]	Nederland [See page 0]

Also, see the topic on how to set [locale preferences in your user profile \[See page 0\]](#) to control language, date, and number formats on the ThoughtSpot UI.

General

Keyword	Examples
top <i>n</i>	<ul style="list-style-type: none">• top 10 sales rep revenue• top sales rep by count sales for average revenue > 10000• sales rep average revenue for each region top

Keyword	Examples
bottom <i>n</i>	<ul style="list-style-type: none"> • bottom 25 customer by revenue for each sales rep • bottom revenue average • bottom revenue by state • customer by revenue for each sales rep bottom
sort by	<ul style="list-style-type: none"> • revenue by state sort by average revenue • revenue by customer sort by region

Note: When using the **top** or **bottom** keywords without specifying a number (*n*), the number defaults to 10.

Date

Keyword	Examples
after	order date after 10/31/2014
before	order date before 03/01/2014
between ... and ...	order date between 01/30/2012 and 01/30/2014
daily	shipments by region daily
day	count monday restaurant
day of week	revenue by day of week last 6 months
day of week	count shipments Monday
week	revenue by week last quarter
weekly	revenue weekly
month year	commission by sales rep February 2014
month	commission January
month	revenue by month last year
monthly	commission > 10000 monthly
quarterly	sales quarterly for each product

Keyword	Examples
year	revenue by product 2014 product name contains snowboard
yearly	shipments by product yearly
week to date	sales by order date week to date for pro-ski200
month to date	sales by product month to date sales > 2400
quarter to date	sales by product quarter to date for top 10 products by sales
year to date	sales by product year to date
last <i>n</i> hours for each day	sales last 2 hours for each day
last <i>n</i> days for each week	total sold last 2 days for each week
last <i>n</i> days for each month	sales last 2 days for each month
last <i>n</i> days for each quarter	revenue last 15 days for each quarter
last <i>n</i> days for each year	revenue last 300 days for each year
next <i>n</i> days for each week	opportunities next 2 days for each week
next <i>n</i> days for each month	opportunities next 2 days for each month
next <i>n</i> days for each quarter	opportunities next 15 days for each quarter
next <i>n</i> days for each year	opportunities next 300 days for each year
last <i>n</i> weeks for each month	sales last 3 weeks for each month
last <i>n</i> weeks for each quarter	sales last 2 weeks for each quarter
last <i>n</i> weeks for each year	sales last 3 weeks for each year
next <i>n</i> weeks for each month	meetings next 3 weeks for each month

Keyword	Examples
next <i>n</i> weeks for each quarter	meetings next 2 weeks for each quarter
next <i>n</i> weeks for each year	meetings next 3 weeks for each year
last <i>n</i> months for each quarter	cost last 2 months for each quarter
last <i>n</i> months for each year	cost last 8 months for each year
next <i>n</i> months for each quarter	projected cost next 2 months for each quarter
next <i>n</i> months for each year	projected cost next 8 months for each year
last <i>n</i> quarters for each year	sales last 2 quarters for each year
next <i>n</i> quarters for each year	projected sales next 2 quarters for each year
daily year-over-year	growth of revenue by order date daily year-over-year
weekly year-over-year	growth of revenue by date shipped weekly year-over-year
monthly year-over-year	growth of revenue by receipt date monthly year-over-year
quarterly year-over-year	growth of revenue by date shipped quarterly year-over-year
growth of ... by ... daily	growth of sales by order date daily
growth of ... by ... weekly	growth of sales by receipt date weekly for pro-ski2000
growth of ... by ... monthly	growth of sales by date shipped monthly sales > 24000
growth of ... by ... quarterly	growth of sales by date shipped quarterly
growth of ... by ... yearly	growth of sales by date closed yearly
growth of ... by ...	growth of sales by order date

Keyword	Examples
last <i>n</i> days	visitors last 7 days
last <i>n</i> weeks	visitors last 10 weeks by day
last <i>n</i> months	visitors last 10 months by day
last <i>n</i> quarters	visitors last 2 quarters by month by campaign
last <i>n</i> years	visitors last 5 years by revenue for sum revenue > 5000
last week	customers last week by store
last month	customers last month by store
last quarter	customers last quarter sale > 300
last year	top 10 customers last year by sale by store for region west
<i>n</i> days ago	sales 2 days ago
<i>n</i> weeks ago	sales 4 weeks ago by store
<i>n</i> months ago	sales 2 months ago by region
<i>n</i> quarters ago	sales 4 quarters ago by product name contains deluxe
<i>n</i> years ago	sales 5 years ago by store for region west
this day	shipments this day by order
this week	shipments this week by store
this month	appointments this month by day
this quarter	opportunities this quarter amount > 30000
this year	opportunities this year by sales rep
next <i>n</i> days	shipments next 7 days
next <i>n</i> weeks	shipments next 10 weeks by day
next <i>n</i> months	openings next 6 months location
next <i>n</i> quarters	opportunities next 2 quarters by campaign
next <i>n</i> years	opportunities next 5 years by revenue
next day	shipments next day by order
next week	shipments next week by store

Keyword	Examples
next month	appointments next month by day
next quarter	opportunities next quarter amount > 30000
next year	opportunities next year by sales rep
today	sales today by store
yesterday	sales yesterday for pro-ski200 by store

Time

Keyword	Examples
detailed	ship time detailed
hourly	visitors by page name hourly
last minute	count homepage views last minute
last hour	count unique visits last hour
last <i>n</i> minutes	count visitors last 30 minutes
last <i>n</i> hours	count visitors last 12 hours
next <i>n</i> minutes	count visitors next 30 minutes
next <i>n</i> hours	count visitors next 12 hours
this minute	count visitors this minute
this hour	count visitors this hour
<i>n</i> minutes ago	sum inventory by product 10 minutes ago

Keyword	Examples
n hours ago	sum inventory by product by store 2 hours ago

Text

Keyword	Examples
begins with	product name begins with 'pro'
contains	product name contains "alpine" description contains "snow shoe"
ends with	product name ends with 'deluxe'
not begins with	product name not begins with "tom's"
not contains	product color not contains 'tan' product color not contains 'red'
not ends with	product name not ends with "trial"
similar to	course name similar to 'hand'
not similar to	course name not similar to 'hand'

Number

Function	Examples
sum	sum revenue
average	average revenue by store
count	count visitors by site
max	max sales by visitor by site
min	min revenue by store by campaign for cost > 5000

Function	Examples
standard deviation	standard deviation revenue by product by month for date after 10/31/2010
unique count	unique count visitor by product page last week
variance	variance sale amount by visitor by product for last year

Comparative

Function	Examples
all	all
between... and	revenue between 0 and 1000
vs, versus	revenue east vs west
>	sum sale amount by visitor by product for last year sale amount > 2000
<	unique count visitor by product by store for sale amount < 20
>=	count calls by employee lastname >= m
<=	count shipments by city latitude <= 0
=	unique count visitor by store purchased products = 3 for last 5 days
!=	sum sale amount region != canada region != mexico

Period

Keyword	Example
quarter (<i>date</i>)	quarter (purchase date)
quarter of year (<i>date</i>)	quarter of year (purchase date)

month of quarter (<i>date</i>)	month of quarter (purchase date)
week of year (<i>date</i>)	week of year (ship date)
week of quarter (<i>date</i>)	week of quarter (ship date)
week of month (<i>date</i>)	week of month (ship date)
day of year (<i>date</i>)	day of year (ship date)
day of quarter (<i>date</i>)	day of quarter (ship date)
day (<i>date</i>)	day (ship date)
day of month (<i>date</i>)	day of month (order date)
day of week (<i>date</i>)	day of week (order date)
hour (<i>datetime</i>)	hour (timestamp)

In

Keyword	Example
<i>attribute</i> in (<i>attribute sub-search</i>)	<i>store name</i> in (top 10 <i>store name</i> by sales footwear) Must match last attribute before keyword with first attribute inside subsearch.

Date and time formats reference

Summary: ThoughtSpot supports several date and time formats.

This is a reference for the date and time contexts and formats you can use with ThoughtSpot. You define data formats in specific contexts and, depending on the context, your choices in data formatting differ. You must understand date and time when you load data in these contexts:

- using data upload from the browser
- through `tsload` command
- through an extract, transform, load (ETL) tool

Data loading formats do not change how data is displayed in tables and charts.

The context where you *can control* date and time formats is data modeling. Data modeling controls how data is displayed in search and their resulting answers.

Data loading formats through `tsload`

When loading through the `tsload` command you must specify `date` and `timestamp` formats using the format specifications defined in the `strftime` library function (<http://man7.org/linux/man-pages/man3/strftime.3.html>). Data is imported based on the timezone of the node from which `tsload` is run.

For `date` data types, the default format is `%Y%m%d`, which translates to `yearmonthday`. For example, `Dec 30th, 2001` is represented as `20011230`. For `time` and `datetime` data types, the default is `%Y%m%d %H:%M:%S` which translates to `yearmonthday hour:minute:second`, for example, `Dec 30th, 2001 1:15:12` is represented as `20011230 01:15:12`.

Data modeling formats for browser data upload

These date and time formats are supported in a CSV file when uploading through the browser. You cannot specify the date format; ThoughtSpot will pick the format that fits your data best:

- `1/30/2014`
- `2014-01-30`

- 2014-1-30
- 30-Jan-2014
- 2014-Jan-30
- 2014-01-30 10:32 AM
- 2014-01-30 14:52
- 2014-01-30 10:32:22
- 2014-01-30 10:32:22 AM
- 2014-01-30 10:32:22.0
- 2014-01-30 10:32:22.0 AM
- 2014-01-30 10:32:22.000
- 2014-01-30 10:32:22.000 AM
- 1/30/2014
- 30-Jan-14
- 01-Mar-02 (assumes 2002)
- 30/1/2014 10:32 AM
- 30/1/2014 14:52
- 30/1/2014 10:32:22
- 30/1/2014 10:32:22 AM
- 30/1/2014 10:32:22.0
- 30/1/2014 10:32:22.0 AM
- 30/1/2014 10:32:22.000
- 30/1/2014 10:32:22.000 AM
- 30-Jan-14 10:32 AM
- 30-Jan-14 14:52
- 30-Jan-14 10:32:22
- 30-Jan-14 10:32:22 AM
- 30-Jan-14 10:32:22.0
- 30-Jan-14 10:32:22.0 AM
- 30-Jan-14 10:32:22.000
- 30-Jan-14 10:32:22.000 AM
- Fri Jan 30 2014 3:26 PM
- Fri Jan 30 2014 13:46
- Fri Jan 30 2014 10:32:22
- Fri Jan 30 2014 10:32:22 AM
- Fri Jan 30 2014 10:32:22.0
- Fri Jan 30 2014 10:32:22.0 AM

- Fri Jan 30 2014 10:32:22.000
- Fri Jan 30 2014 10:32:22.000 AM
- 14:52
- 10:32 AM
- 10:32:22
- 10:32:22 AM
- 10:32:22.0
- 10:32:22.000
- 10:32:22.0 AM
- 10:32:22.000 AM

Data loading formats through an ETL tool

Data loads through ETL uses ODBC or JDBC connections. After you extract the data from the source but before you load it into ThoughtSpot, you must transform any date or timestamp columns into a format that is valid for ThoughtSpot. After the data transformation completes, there is no requirement for explicit data masking. See the data integration guide for more information on loading data through ODBC and JDBC.

Data modeling formats

A user with administrative rights can configure data modeling for data on one or all files. You can set number, date, and currency display formats. These formats define how these value types display in tables and charts. See the Admin Guide for more information about data modeling settings. The following format strings are available for use:

Format mask	Description
YYYY or yyyy	four digit year such as 2017
YY or yy	last two digits of year such as 17
M	month with no leading zero 1 - 12
MM	Two digit month 01 - 12
MMM	Three letter month such as Jan
D	Day of year without a leading zero 0 - 365

Format mask	Description
DD	Day of year with up to one leading zero 01 - 365
DDD	Day of year with up to two leading zeroes 001 - 365
d	Day of month with no leading zero 1 - 31
dd	Two digit day of month 01 - 31
HH	Two digit 24 hour representation of hour 00 - 23
hh	Two digit 12 hour representation of hour 01 - 12
H	24 hour representation of hour with no leading zero 0 - 23
h	12 hour representation of hour with no leading zero 1 - 12
mm	Minutes 00 - 59
m	Minutes with no leading zero 0 - 59
ss	Seconds 00 - 59
s	Seconds with no leading zero 0 - 59
a	AM/PM indicator

Valid delimiters include most non-alphabet characters. This includes but is not limited to:

- \ (forward slash)
- / (backward slash)
- | (pipe symbol)
- : (colon)
- – (dash)
- _ (underscore)
- = (equal sign)

Examples of valid format masks you can produce for display are as follows:

- MM/dd/yyyy
- MMM
- DD/MM/yyyy
- MM/dd/yyyy HH:mm
- DD/MM/yyyy HH:mm

Row level security rules reference

Summary: Learn the operators and functions you can use to create rules for row level security.

ThoughtSpot allows you to create row level security rules using expressions. If an expression evaluates to “true” for a particular row and group combination, that group will be able to see that row. This reference lists the various operators and functions you can use to create rules.

For information on how to use the row level security functions and operators, see [About Rule-Based Row Level Security \[See page 0\]](#). There is a special variable called `ts_groups`, which you can use when creating row level security rules. It fetches a list of the groups that the currently logged in user belongs to. For each row, if the expression in the rule evaluates to ‘true’ for any one of these groups, that row will be shown to the user.

You can also see this list of operators and examples from within the Rule Builder by selecting **Rule Assistant**.

Conversion functions

These functions can be used to convert data from one data type to another. Conversion to or from date data types is not supported.

Function	Description	Examples
<code>to_bool</code>	Returns the input as a boolean data type (<code>true</code> or <code>false</code>).	<code>to_bool (0) = false</code> <code>to_bool (married)</code>

Function	Description	Examples
to_date	<p>Accepts a date represented as an integer or text string, and a second string parameter that can include <code>strftime</code> date formatting elements.</p> <p>Replaces all the valid <code>strftime</code> date formatting elements with their string counterparts and returns the result.</p> <p>Does not accept epoch formatted dates as input.</p>	<code>to_date (date_sold, '%Y-%m-%d')</code>
to_double	Returns the input as a double data type.	<code>to_double ('3.14') = 3.14</code> <code>to_double (revenue * .01)</code>
to_integer	Returns the input as an integer.	<code>to_integer ('45') + 1 = 46</code> <code>to_integer (price + tax - cost)</code>
to_string	Returns the input as a text string. To convert a date data type to a string data type, specify the date format you want to use.	<code>to_string (45 + 1) = '46'</code> <code>to_string (revenue - cost)</code> <code>to_string (date, ('%m/%d/%y'))</code>

Date functions

Function	Description	Examples
add_days	Returns the result of adding the specified number of days to the given date.	<code>add_days (01/30/2015, 5) = 02/04/2015</code> <code>add_days (invoiced, 30)</code>
add_minutes	Returns the result of adding the specified number of minutes to the given date/datetime/time.	<code>add_minutes (01/30/2015 00:10:20 , 5) = 01/30/2015 00:15:20</code> <code>add_minutes (invoiced , 30)</code>

Function	Description	Examples
add_months	Returns the result of adding the specified number of months to the given date.	<code>add_months (01/30/2015, 5) = 06/30/2015</code> <code>add_months (invoiced_date , 5)</code>
add_seconds	Returns the result of adding the specified number of seconds to the given date/ datetime/time.	<code>add_seconds (01/30/2015 00:00:00, 5) = 06/30/2015 00:00:05</code> <code>add_seconds (invoiced_date , 5)</code>
add_weeks	Returns the result of adding the specified number of weeks to the given date.	<code>add_weeks (01/30/2015, 2) = 02/13/2015</code> <code>add_weeks (invoiced_date , 2)</code>
add_years	Returns the result of adding the specified number of years to the given date.	<code>add_years (01/30/2015, 5) = 01/30/2020</code> <code>add_years (invoiced_date , 5)</code>
date	Returns the date portion of a given date.	<code>date (home visit)</code>
day	Returns the number (1-31) of the day of the month for the given date.	<code>day (01/15/2014) = 15</code> <code>day (date ordered)</code>
day_number_of_quarter	Returns the number of the day in a quarter for a given date. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<code>day_number_of_quarter (01/30/2015) = 30</code> In the following example, May 1st is the start of the fiscal year. <code>day_number_of_quarter (01/30/2015, 'fiscal') = 91</code>
day_number_of_week	Returns the number (1-7) of the day in a week for a given date. Monday is 1, and Sunday is 7.	<code>day_number_of_week(01/15/2014) = 3</code> <code>day_number_of_week (shipped)</code>

Function	Description	Examples
day_number_of_year	Returns the number (1-366) of the day in a year from a given date. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<pre>day_number_of_year (01/30/2015) = 30</pre> <p>In the following example, May 1st is the start of the fiscal year.</p> <pre>day_number_of_year (01/30/2015, 'fiscal') = 275 day_number_of_year (invoiced)</pre>
day_of_week	Returns the day of the week for the given date.	<pre>day_of_week (01/30/2015) = Friday day_of_week (serviced)</pre>
diff_days	Subtracts the second date from the first date and returns the result in number of days, rounded down if not exact.	<pre>diff_days (01/15/2014, 01/17/2014) = -2</pre> <pre>diff_days (purchased, shipped)</pre>
diff_time	Subtracts the second date from the first date and returns the result in number of seconds.	<pre>diff_time (01/30/2014, 01/31/2014) = -86,400</pre> <pre>diff_time (clicked, submitted)</pre>
hour_of_day	Returns the hour of the day for the given date.	<pre>hour_of_day (received)</pre>
is_weekend	Returns true if the given date falls on a Saturday or Sunday.	<pre>is_weekend (01/31/2015) = true is_weekend (emailed)</pre>
month	Returns the month from the given date.	<pre>month (01/15/2014) = January month (date ordered)</pre>

Function	Description	Examples
month_number	Returns the number (1-12) of the month from a given date. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<pre>month_number (09/20/2014) = 9</pre> <p>In the following example, May 1st is the start of the fiscal year.</p> <pre>month_number (09/20/2014, 'fiscal') = 5 month_number (purchased)</pre>
month_number_of_quarter	Returns the month (1-3) number for the given date in a quarter. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<pre>month_number_of_quarter (02/20/2018) = 2</pre> <p>In the following example, May 1st is the start of the fiscal year.</p> <pre>month_number_of_quarter (02/20/2018, 'fiscal') = 1</pre>
now	Returns the current timestamp.	<pre>now ()</pre>
quarter_number	Returns the number (1-4) of the quarter associated with the given date. You can add an optional second parameter to specify 'fiscal' or 'calendar' dates. The default is 'calendar'.	<pre>quarter_number (04/14/2014) = 2</pre> <p>In the following example, May 1st is the start of the fiscal year.</p> <pre>quarter_number (04/14/2014, 'fiscal') = 4 quarter_number (shipped)</pre>

Function	Description	Examples
<code>start_of_month</code>	Returns MMM yyyy for the first day of the month. Your installation configuration can override this setting so that it returns a different format such as MM/dd/yyyy . Speak with your ThoughtSpot administrator for information on doing this.	<code>start_of_month (01/31/2015) = Jan FY 2015</code> <code>start_of_month (shipped)</code>
<code>start_of_quarter</code>	Returns the date for the first day of the quarter for the given date. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<code>start_of_quarter (04/30/2014) = Apr 2014</code> In the following example, May 1st is the start of the fiscal year. <code>start_of_quarter (04/30/2014, 'fiscal') = Feb 2014</code> <code>start_of_quarter (sold)</code>
<code>start_of_week</code>	Returns the date for the first day of the week for the given date.	<code>start_of_week (01/31/2020) = 01/27/2020</code> <code>start_of_week (emailed)</code>
<code>start_of_year</code>	Returns the date for the first day of the year for the given date. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<code>start_of_year (04/30/2014) returns Jan 2014</code> In the following example, May 1st is the start of the fiscal year. <code>start_of_year (04/30/2014, 'fiscal') returns May 2013</code> <code>start_of_year (joined)</code>
<code>time</code>	Returns the time portion of a given date.	<code>time (1/31/2002 10:32) = 10:32</code> <code>time (call began)</code>
<code>today</code>	Returns the current date.	<code>today ()</code>

Function	Description	Examples
<code>week_number_of_month</code>	Returns the week number for the given date in a month.	<code>week_number_of_month(03/23/2017) = 3</code>
<code>week_number_of_quarter</code>	Returns the week number for the given date in a quarter. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<code>week_number_of_quarter (01/31/2020) = 5</code> In the following example, May 1st is the start of the fiscal year. <code>week_number_of_quarter (05/31/2020, 'fiscal') = 5</code>
<code>week_number_of_year</code>	Returns the week number for the given date in a year. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<code>week_number_of_year (01/17/2014) = 3</code> In the following example, May 1st is the start of the fiscal year. <code>week_number_of_year (01/17/2014, 'fiscal') = 38</code>
<code>year</code>	Returns the year from a given date. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<code>year (01/15/2014) = 2014</code> In the following example, May 1st is the start of the fiscal year. Per standard convention, the fiscal year is defined by the year-end date. <code>year (12/15/2013, 'fiscal') = 2014</code> <code>year (date ordered)</code>

Mixed functions

These functions can be used with text and numeric data types.

Function	Description	Examples
<code>!=</code>	Returns true if the first value is not equal to the second value.	<code>3 != 2 = true</code> <code>revenue != 1000000</code>
<code><</code>	Returns true if the first value is less than the second value.	<code>3 < 2 = false</code> <code>revenue < 1000000</code>
<code><=</code>	Returns true if the first value is less than or equal to the second value.	<code>1 <= 2 = true</code> <code>revenue <= 1000000</code>
<code>=</code>	Returns true if the first value is equal to the second value.	<code>2 = 2 = true</code> <code>revenue = 1000000</code>
<code>></code>	Returns true if the first value is greater than the second value.	<code>3 > 2 = true</code> <code>revenue > 1000000</code>
<code>>=</code>	Returns true if the first value is greater than or equal to the second value.	<code>3 >= 2 = true</code> <code>revenue >= 1000000</code>
<code>greatest</code>	Returns the larger of the values.	<code>greatest (20, 10) = 20</code> <code>greatest (q1 revenue, q2 revenue)</code>
<code>least</code>	Returns the smaller of the values.	<code>least (20, 10) = 10</code> <code>least (q1 revenue, q2 revenue)</code>

Number functions

Function	Description	Examples
<code>*</code>	Returns the result of multiplying both numbers.	<code>3 * 2 = 6</code> <code>price * taxrate</code>
<code>+</code>	Returns the result of adding both numbers.	<code>1 + 2 = 3</code> <code>price + shipping</code>
<code>-</code>	Returns the result of subtracting the second number from the first.	<code>3 - 2 = 1</code> <code>revenue - tax</code>
<code>/</code>	Returns the result of dividing the first number by the second.	<code>6 / 3 = 2</code> <code>markup / retail price</code>
<code>^</code>	Returns the first number raised to the power of the second.	<code>3 ^ 2 = 9</code> <code>width ^ 2</code>

Function	Description	Examples
abs	Returns the absolute value.	abs (-10) = 10 abs (profit)
acos	Returns the inverse cosine in degrees.	acos (0.5) = 60 acos (cos-satellite-angle)
asin	Returns the inverse sine (specified in degrees).	asin (0.5) = 30 asin (sin-satellite-angle)
atan	Returns the inverse tangent in degrees.	atan (1) = 45 atan (tan-satellite-angle)
atan2	Returns the inverse tangent in degrees.	atan2 (10, 10) = 45 atan2 (longitude, latitude)
cbrt	Returns the cube root of a number.	cbrt (27) = 3 cbrt (volume)
ceil	Returns the smallest following integer.	ceil (5.9) = 6 ceil (growth rate)
cos	Returns the cosine of an angle (specified in degrees).	cos (63) = 0.45 cos (beam angle)
cube	Returns the cube of a number.	cube (3) = 27 cube (length)
exp	Returns Euler's number (~2.718) raised to a power.	exp (2) = 7.38905609893 exp (growth)
exp2	Returns 2 raised to a power.	exp2 (3) = 8 exp2 (growth)
floor	Returns the largest previous integer.	floor (5.1) = 5 floor (growth rate)
ln	Returns the natural logarithm.	ln (7.38905609893) = 2 ln (distance)
log10	Returns the logarithm with base 10.	log10 (100) = 2 log10 (volume)
log2	Returns the logarithm with base 2 (binary logarithm).	log2 (32) = 5 log2 (volume)
mod	Returns the remainder of first number divided by the second number.	mod (8, 3) = 2 mod (revenue, quantity)

Function	Description	Examples
pow	Returns the first number raised to the power of the second number.	<code>pow (5, 2) = 25</code> <code>pow (width, 2)</code>
random	Returns a random number between 0 and 1.	<code>random () = .457718</code> <code>random ()</code>
round	Returns the first number rounded to the second number (the default is 1).	<code>round (35.65, 10) = 40</code> <code>round (battingavg, 100)</code> <code>round (48.67, .1) = 48.7</code>
safe_divide	Returns the result of dividing the first number by the second. If the second number is 0, returns 0 instead of NaN (not a number).	<code>safe_divide (12, 0) = 0</code> <code>safe_divide (total_cost, units)</code>
sign	Returns +1 if the number is greater than zero, -1 if less than zero, 0 if zero.	<code>sign (-250) = -1</code> <code>sign (growth_rate)</code>
sin	Returns the sine of an angle (specified in degrees).	<code>sin (35) = 0.57</code> <code>sin (beam_angle)</code>
spherical_distance	Returns the distance in km between two points on Earth.	<code>spherical_distance (37.465191, -122.153617, 37.421962, -122.142174) = 4,961.96</code> <code>spherical_distance (start_latitude, start_longitude, start_latitude, start_longitude)</code>
sq	Returns the square of a numeric value.	<code>sq (9) = 81</code> <code>sq (width)</code>
sqrt	Returns the square root.	<code>sqrt (9) = 3</code> <code>sqrt (area)</code>
tan	Returns the tangent of an angle (specified in degrees).	<code>tan (35) = 0.7</code> <code>tan (beam_angle)</code>

Operators

Operator	Description	Examples
and	Returns <code>true</code> when both conditions are <code>true</code> , otherwise returns <code>false</code> .	<code>(1 = 1) and (3 > 2) = true</code> <code>lastname = 'smith' and state = 'texas'</code>
		Note: Not available for row-level security (RLS) formulas.
if...then...else	Conditional operator	<code>if (3 > 2) then 'bigger' else 'not bigger'</code> <code>if (cost > 500) then 'flag' else 'approve'</code>
ifnull	Returns the first value if it is not <code>null</code> , otherwise returns the second value.	<code>ifnull (cost, 'unknown')</code>
in	Takes a column name and a list of values. It checks each column value against the list of values in the formula, and returns <code>true</code> if the column value matches one of the values in the formula.	<code>state in { 'texas' , 'california' }</code>
isnull	Returns <code>true</code> if the value is <code>null</code> .	<code>isnull (phone)</code>
not	Returns <code>true</code> if the condition is <code>false</code> , otherwise returns <code>false</code> .	<code>not (3 > 2) = false</code> <code>not (state = 'texas')</code>
or	Returns <code>true</code> when either condition is <code>true</code> , otherwise returns <code>false</code> .	<code>(1 = 5) or (3 > 2) = true</code> <code>state = 'california' or state = 'oregon'</code>

Text functions

Function	Description	Examples
concat	Returns two or more values as a concatenated text string. Use single quotes around each literal string, not double quotes.	<code>concat ('hay' , 'stack') = 'haystack'</code> <code>concat (title, ' ', first_name , ' ', last_name)</code>
contains	Returns true if the first string contains the second string, otherwise returns false.	<code>contains ('broomstick', 'room') = true</code> <code>contains (product, 'trial version')</code>
edit_distance	Accepts two text strings. Returns the edit distance (minimum number of operations required to transform one string into the other) as an integer. Works with strings under 1023 characters.	<code>edit_distance ('attorney', 'atty') = 4</code> <code>edit_distance (color, 'red')</code>
edit_distance_with_cap	Accepts two text strings and an integer to specify the upper limit cap for the edit distance (minimum number of operations required to transform one string into the other). If the edit distance is less than or equal to the specified cap, returns the edit distance. If it is higher than the cap, returns the cap plus 1. Works with strings under 1023 characters.	<code>edit_distance_with_cap ('pokemon go', 'minecraft pixelmon', 3) = 4</code> <code>edit_distance_with_cap (event, 'burning man', 3)</code>
similar_to	Accepts a document text string and a search text string. Returns true if relevance score (0-100) of the search string with respect to the document is greater than or equal to 20. Relevance is based on edit distance, number of words in the query, and length of words in the query which are present in the document.	<code>similar_to ('hello world', 'hello swirl') = true</code> <code>similar_to (current team, drafted by)</code>

Function	Description	Examples
similarity	Accepts a document text string and a search text string. Returns the relevance score (0-100) of the search string with respect to the document. Relevance is based on edit distance, number of words in the query, and length of words in the query which are present in the document. If the two strings are an exact match, returns 100.	similarity ('where is the burning man concert', 'burning man') = 46 similarity (tweet1, tweet2)
spells_like	Accepts two text strings. Returns true if they are spelled similarly and false if they are not. Works with strings under 1023 characters.	spells_like ('thouhgtspot', 'thoughtspot') = true spells_like (studio, distributor)
strlen	Returns the length of the text.	strlen ('smith') = 5 strlen (lastname)
strpos	Returns the numeric position (starting from 0) of the first occurrence of the second string in the first string, or -1 if not found.	strpos ('haystack_with_needles', 'needle') = 14 strpos (complaint, 'lawyer')
substr	Returns the portion of the given string, beginning at the location specified (starting from 0), and of the given length.	substr ('persnickety', 3, 7) = snicket substr (lastname, 0, 5)

Variables

These variables can be used in your expressions.

Function	Description	Examples
ts_groups	Returns a list of all the groups the current logged in user belongs to. For any row, if the expression evaluates to true for any of the groups, the user can see that row.	ts_groups = 'east'
ts_username	Returns the user with the matching name.	ts_username != 'mark'

⚠ Note: You cannot use these variables (ts_groups and ts_username) within an expression. For example, `ts_groups = substr(rls_group_name, 0, 3)` is valid, but `substr(ts_groups,0,3) = rls_group_name` is NOT valid.

Formula function reference

Summary: Learn the operators and functions you can use to create formulas in ThoughtSpot.

ThoughtSpot allows you to create derived columns in worksheets using formulas. You create these columns by building formulas using the **Formula Assistant**. An individual formula is constructed from *n* combination of operators and functions.

This reference lists the various operators and functions you can use to create formulas.

Operators

Operator	Description	Examples
and	Returns <code>true</code> when both conditions are <code>true</code> , otherwise returns <code>false</code> .	<code>(1 = 1) and (3 > 2) = true</code> <code>lastname = 'smith' and state = 'texas'</code>
		Note: Not available for row-level security (RLS) formulas.
if...then...else	Conditional operator	<code>if (3 > 2) then 'bigger' else 'not bigger'</code> <code>if (cost > 500) then 'flag' else 'approve'</code>
ifnull	Returns the first value if it is not <code>null</code> , otherwise returns the second value.	<code>ifnull (cost, 'unknown')</code>
in	Takes a column name and a list of values. It checks each column value against the list of values in the formula, and returns <code>true</code> if the column value matches one of the values in the formula.	<code>state in { 'texas' , 'california' }</code>
isnull	Returns <code>true</code> if the value is <code>null</code> .	<code>isnull (phone)</code>
not	Returns <code>true</code> if the condition is <code>false</code> , otherwise returns <code>false</code> .	<code>not (3 > 2) = false</code> <code>not (state = 'texas')</code>

Operator	Description	Examples
or	Returns true when either condition is true , otherwise returns false .	(1 = 5) or (3 > 2) = true state = 'california' or state ='oregon'

Aggregate functions (group aggregate)

Use the following functions to aggregate data.

Function	Description	Examples
average	Returns the average of all the values of a column.	average (revenue)
average_if	Returns the average of all the columns that meet a given criteria.	average_if(city = "San Francisco", revenue)
count	Returns the number of rows in the table containing the column.	count (product)
count_if	Returns the number of rows in the table containing the column.	count_if(region ='west', region)
cumulative_average	Takes a measure and one or more attributes. Returns the average of the measure, accumulated by the attribute(s) in the order specified.	cumulative_average (revenue, order date, state)
cumulative_max	Takes a measure and one or more attributes. Returns the maximum of the measure, accumulated by the attribute(s) in the order specified.	cumulative_max (revenue, state)
cumulative_min	Takes a measure and one or more attributes. Returns the minimum of the measure, accumulated by the attribute(s) in the order specified.	cumulative_min (revenue, campaign)

Function	Description	Examples
cumulative_sum	Takes a measure and one or more attributes. Returns the sum of the measure, accumulated by the attribute(s) in the order specified.	<code>cumulative_sum (revenue, order date)</code>
group_aggregate	Takes a measure and optional attributes and filters. Used to aggregate measures with different granularities and filters than the columns used in the search. Commonly used in comparison analysis. This formula takes the following form: <code>group_aggregate (<aggregation(measure)>, <groupings>, <filters>)</code>	<code>group_aggregate (sum (revenue), {ship mode, date}, {})</code> <code>group_aggregate (sum (revenue), {ship mode , date}, {day_of_week (date) = 'friday'}))</code> <code>group_aggregate (sum (revenue), query_groups(), query_filters())</code> <code>group_aggregate (sum (revenue), query_groups() + {date}, query_filters())</code>
	Define lists using curly brackets, <code>{ }</code> . Optional list functions <code>query_groups</code> or <code>query_filters</code> specify the lists or filters used in the original search. Use <code>+</code> (plus) and <code>-</code> (minus) to add or exclude specific columns for query groups. See Flexible aggregation functions [See page 0] .	
group_average	Takes a measure and one or more attributes. Returns the average of the measure grouped by the attribute(s).	<code>group_average (revenue, customer region, state)</code>
group_count	Takes a measure and one or more attributes. Returns the count of the measure grouped by the attribute(s).	<code>group_count (revenue, customer region)</code>
group_max	Takes a measure and one or more attributes. Returns the maximum of the measure grouped by the attribute(s).	<code>group_max (revenue, customer region)</code>

Function	Description	Examples
group_min	Takes a measure and one or more attributes. Returns the minimum of the measure grouped by the attribute(s).	group_min (revenue, customer region)
group_stddev	Takes a measure and one or more attributes. Returns the standard deviation of the measure grouped by the attribute(s).	group_stddev (revenue, customer region)
group_sum	Takes a measure and one or more attributes. Returns the sum of the measure grouped by the attribute(s).	group_sum (revenue, customer region)
group_unique_count	Takes a measure and one or more attributes. Returns the unique count of the measure grouped by the attribute(s).	group_unique_count (product , supplier)
group_variance	Takes a measure and one or more attributes. Returns the variance of the measure grouped by the attribute(s).	group_variance (revenue, customer region)
max	Returns the maximum value of a column.	max (sales)
max_if	Returns the maximum value among columns that meet a criteria.	max_if((revenue > 10) , customer region)
min	Returns the minimum value of a column.	min (revenue)
min_if	Returns the minimum value among columns that meet a criteria.	min_if((revenue < 10) , customer region)

Function	Description	Examples
<code>moving_average</code>	Takes a measure, two integers to define the window to aggregate over, and one or more attributes. The window is (current - Num1...Current + Num2) with both end points being included in the window. For example, "1,1" will have a window size of 3. To define a window that begins before Current, specify a negative number for Num2. Returns the average of the measure over the given window. The attributes are the ordering columns used to compute the moving average.	<code>moving_average (revenue, 2, 1, customer region)</code>
<code>moving_max</code>	Takes a measure, two integers to define the window to aggregate over, and one or more attributes. The window is (current - Num1...Current + Num2) with both end points being included in the window. For example, "1,1" will have a window size of 3. To define a window that begins before Current, specify a negative number for Num2. Returns the maximum of the measure over the given window. The attributes are the ordering columns used to compute the moving maximum.	<code>moving_max (complaints, 1, 2, store name)</code>

Function	Description	Examples
<code>moving_min</code>	Takes a measure, two integers to define the window to aggregate over, and one or more attributes. The window is (current - Num1...Current + Num2) with both end points being included in the window. For example, "1,1" will have a window size of 3. To define a window that begins before Current, specify a negative number for Num2. Returns the minimum of the measure over the given window. The attributes are the ordering columns used to compute the moving minimum.	<code>moving_min (defects, 3, 1, product)</code>
<code>moving_sum</code>	Takes a measure, two integers to define the window to aggregate over, and one or more attributes. The window is (current - Num1...Current + Num2) with both end points being included in the window. For example, "1,1" will have a window size of 3. To define a window that begins before Current, specify a negative number for Num2. Returns the sum of the measure over the given window. The attributes are the ordering columns used to compute the moving sum.	<code>moving_sum (revenue, 1, 1, order date)</code>
<code>rank</code>	Returns the rank for the current row. Identical values receive an identical rank. Takes an aggregate input for the first argument. The second argument specifies the order, 'asc' 'desc' .	<code>rank (sum (revenue) , 'asc')</code> <code>rank (sum (revenue) , 'desc')</code>

Function	Description	Examples
rank_percentile	Returns the percentile rank for the current row. Identical values are assigned an identical percentile rank. Takes an aggregate input for the first argument. The second argument specifies the order, 'asc' 'desc' .	rank_percentile (sum (revenue) , 'asc') rank_percentile (sum (revenue) , 'desc')
stddev	Returns the standard deviation of all values of a column.	stddev (revenue)
stddev_if	Returns a standard deviation values filtered to meet a specific criteria.	stddev_if((revenue > 10) , (revenue/10.0))
sum	Returns the sum of all the values of a column.	sum (revenue)
sum_if	Returns sum values filtered by a specific criteria.	sum_if(region='west', revenue)
unique_count	Returns the number of unique values of a column.	unique_count (customer)
unique_count_if	Returns the number of unique values of a column provided it meets a criteria.	unique_count_if((revenue > 10) , order date)
variance	Returns the variance of all the values of a column.	variance (revenue)
variance_if	Returns the variance of all the values of a column provided it meets a criteria..	variance_if((revenue > 10) , (revenue/10.0))

Conversion functions

Use these functions to convert data from one data type into another data type.

ThoughtSpot does not support **date** data type conversion.

Function	Description	Examples
<code>to_bool</code>	Returns the input as a boolean data type (true or false).	<code>to_bool (0) = false</code> <code>to_bool (married)</code>
<code>to_date</code>	Accepts a date represented as an integer or text string, and a second string parameter that can include strftime date formatting elements. Replaces all the valid strftime date formatting elements with their string counterparts and returns the result. Does not accept epoch formatted dates as input.	<code>to_date (date_sold, '%Y-%m-%d')</code>
<code>to_double</code>	Returns the input as a double data type.	<code>to_double ('3.14') = 3.14</code> <code>to_double (revenue * .01)</code>
<code>to_integer</code>	Returns the input as an integer.	<code>to_integer ('45') + 1 = 46</code> <code>to_integer (price + tax - cost)</code>
<code>to_string</code>	Returns the input as a text string. To convert a date data type to a string data type, specify the date format you want to use.	<code>to_string (45 + 1) = '46'</code> <code>to_string (revenue - cost)</code> <code>to_string (date, ('%m/%d/%y'))</code>

Date functions

Function	Description	Examples
<code>add_days</code>	Returns the result of adding the specified number of days to the given date.	<code>add_days (01/30/2015, 5) = 02/04/2015</code> <code>add_days (invoiced, 30)</code>

Function	Description	Examples
add_minutes	Returns the result of adding the specified number of minutes to the given date/datetime/time.	<code>add_minutes (01/30/2015 00:10:20 , 5) = 01/30/2015 00:15:20</code> <code>add_minutes (invoiced , 30)</code>
add_months	Returns the result of adding the specified number of months to the given date.	<code>add_months (01/30/2015, 5) = 06/30/2015</code> <code>add_months (invoiced_date , 5)</code>
add_seconds	Returns the result of adding the specified number of seconds to the given date/ datetime/ time.	<code>add_seconds (01/30/2015 00:00:00, 5) = 06/30/2015 00:00:05</code> <code>add_seconds (invoiced_date , 5)</code>
add_weeks	Returns the result of adding the specified number of weeks to the given date.	<code>add_weeks (01/30/2015, 2) = 02/13/2015</code> <code>add_weeks (invoiced_date , 2)</code>
add_years	Returns the result of adding the specified number of years to the given date.	<code>add_years (01/30/2015, 5) = 01/30/2020</code> <code>add_years (invoiced_date , 5)</code>
date	Returns the date portion of a given date.	<code>date (home visit)</code>
day	Returns the number (1-31) of the day of the month for the given date.	<code>day (01/15/2014) = 15</code> <code>day (date ordered)</code>
day_number_of_quarter	Returns the number of the day in a quarter for a given date. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<code>day_number_of_quarter (01/30/2015) = 30</code> In the following example, May 1st is the start of the fiscal year. <code>day_number_of_quarter (01/30/2015, 'fiscal') = 91</code>

Function	Description	Examples
day_number_of_week	Returns the number (1-7) of the day in a week for a given date. Monday is 1, and Sunday is 7.	day_number_of_week(01/15/2014) = 3 day_number_of_week (shipped)
day_number_of_year	Returns the number (1-366) of the day in a year from a given date. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	day_number_of_year (01/30/2015) = 30 In the following example, May 1st is the start of the fiscal year. day_number_of_year (01/30/2015, 'fiscal') = 275 day_number_of_year (invoiced)
day_of_week	Returns the day of the week for the given date.	day_of_week (01/30/2015) = Friday day_of_week (serviced)
diff_days	Subtracts the second date from the first date and returns the result in number of days, rounded down if not exact.	diff_days (01/15/2014, 01/17/2014) = -2 diff_days (purchased, shipped)
diff_time	Subtracts the second date from the first date and returns the result in number of seconds.	diff_time (01/30/2014, 01/31/2014) = -86,400 diff_time (clicked, submitted)
hour_of_day	Returns the hour of the day for the given date.	hour_of_day (received)
is_weekend	Returns true if the given date falls on a Saturday or Sunday.	is_weekend (01/31/2015) = true is_weekend (emailed)
month	Returns the month from the given date.	month (01/15/2014) = January month (date ordered)

Function	Description	Examples
month_number	Returns the number (1-12) of the month from a given date. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<pre>month_number (09/20/2014) = 9</pre> <p>In the following example, May 1st is the start of the fiscal year.</p> <pre>month_number (09/20/2014, 'fiscal') = 5</pre> <pre>month_number (purchased)</pre>
month_number_of_quarter	Returns the month (1-3) number for the given date in a quarter. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<pre>month_number_of_quarter (02/20/2018) = 2</pre> <p>In the following example, May 1st is the start of the fiscal year.</p> <pre>month_number_of_quarter (02/20/2018, 'fiscal') = 1</pre>
now	Returns the current timestamp.	<pre>now ()</pre>
quarter_number	Returns the number (1-4) of the quarter associated with the given date. You can add an optional second parameter to specify 'fiscal' or 'calendar' dates. The default is 'calendar'.	<pre>quarter_number (04/14/2014) = 2</pre> <p>In the following example, May 1st is the start of the fiscal year.</p> <pre>quarter_number (04/14/2014, 'fiscal') = 4</pre> <pre>quarter_number (shipped)</pre>

Function	Description	Examples
<code>start_of_month</code>	Returns MMM yyyy for the first day of the month. Your installation configuration can override this setting so that it returns a different format such as MM/dd/yyyy . Speak with your ThoughtSpot administrator for information on doing this.	<code>start_of_month (01/31/2015) = Jan FY 2015</code> <code>start_of_month (shipped)</code>
<code>start_of_quarter</code>	Returns the date for the first day of the quarter for the given date. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<code>start_of_quarter (04/30/2014) = Apr 2014</code> In the following example, May 1st is the start of the fiscal year. <code>start_of_quarter (04/30/2014, 'fiscal') = Feb 2014</code> <code>start_of_quarter (sold)</code>
<code>start_of_week</code>	Returns the date for the first day of the week for the given date.	<code>start_of_week (01/31/2020) = 01/27/2020</code> <code>start_of_week (emailed)</code>
<code>start_of_year</code>	Returns the date for the first day of the year for the given date. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<code>start_of_year (04/30/2014) returns Jan 2014</code> In the following example, May 1st is the start of the fiscal year. <code>start_of_year (04/30/2014, 'fiscal') returns May 2013</code> <code>start_of_year (joined)</code>
<code>time</code>	Returns the time portion of a given date.	<code>time (1/31/2002 10:32) = 10:32</code> <code>time (call began)</code>
<code>today</code>	Returns the current date.	<code>today ()</code>

Function	Description	Examples
week_number_of_month	Returns the week number for the given date in a month.	<code>week_number_of_month(03/23/2017) = 3</code>
week_number_of_quarter	Returns the week number for the given date in a quarter. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<code>week_number_of_quarter (01/31/2020) = 5</code> In the following example, May 1st is the start of the fiscal year. <code>week_number_of_quarter (05/31/2020, 'fiscal') = 5</code>
week_number_of_year	Returns the week number for the given date in a year. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<code>week_number_of_year (01/17/2014) = 3</code> In the following example, May 1st is the start of the fiscal year. <code>week_number_of_year (01/17/2014, 'fiscal') = 38</code>
year	Returns the year from a given date. You can add an optional second parameter to specify whether a 'fiscal' or 'calendar' year is used to calculate the result. The default is 'calendar'.	<code>year (01/15/2014) = 2014</code> In the following example, May 1st is the start of the fiscal year. Per standard convention, the fiscal year is defined by the year-end date. <code>year (12/15/2013, 'fiscal') = 2014</code> <code>year (date ordered)</code>

Mixed functions

These functions can be used with text and numeric data types.

Function	Description	Examples
<code>!=</code>	Returns true if the first value is not equal to the second value.	<code>3 != 2 = true</code> <code>revenue != 1000000</code>
<code><</code>	Returns true if the first value is less than the second value.	<code>3 < 2 = false</code> <code>revenue < 1000000</code>
<code><=</code>	Returns true if the first value is less than or equal to the second value.	<code>1 <= 2 = true</code> <code>revenue <= 1000000</code>
<code>=</code>	Returns true if the first value is equal to the second value.	<code>2 = 2 = true</code> <code>revenue = 1000000</code>
<code>></code>	Returns true if the first value is greater than the second value.	<code>3 > 2 = true</code> <code>revenue > 1000000</code>
<code>>=</code>	Returns true if the first value is greater than or equal to the second value.	<code>3 >= 2 = true</code> <code>revenue >= 1000000</code>
<code>greatest</code>	Returns the larger of the values.	<code>greatest (20, 10) = 20</code> <code>greatest (q1 revenue, q2 revenue)</code>
<code>least</code>	Returns the smaller of the values.	<code>least (20, 10) = 10</code> <code>least (q1 revenue, q2 revenue)</code>

Number functions

Function	Description	Examples
<code>*</code>	Returns the result of multiplying both numbers.	<code>3 * 2 = 6</code> <code>price * taxrate</code>
<code>+</code>	Returns the result of adding both numbers.	<code>1 + 2 = 3</code> <code>price + shipping</code>
<code>-</code>	Returns the result of subtracting the second number from the first.	<code>3 - 2 = 1</code> <code>revenue - tax</code>
<code>/</code>	Returns the result of dividing the first number by the second.	<code>6 / 3 = 2</code> <code>markup / retail price</code>
<code>^</code>	Returns the first number raised to the power of the second.	<code>3 ^ 2 = 9</code> <code>width ^ 2</code>

Function	Description	Examples
abs	Returns the absolute value.	<code>abs (-10) = 10</code> <code>abs (profit)</code>
acos	Returns the inverse cosine in degrees.	<code>acos (0.5) = 60</code> <code>acos (cos-satellite-angle)</code>
asin	Returns the inverse sine (specified in degrees).	<code>asin (0.5) = 30</code> <code>asin (sin-satellite-angle)</code>
atan	Returns the inverse tangent in degrees.	<code>atan (1) = 45</code> <code>atan (tan-satellite-angle)</code>
atan2	Returns the inverse tangent in degrees.	<code>atan2 (10, 10) = 45</code> <code>atan2 (longitude, latitude)</code>
cbrt	Returns the cube root of a number.	<code>cbrt (27) = 3</code> <code>cbrt (volume)</code>
ceil	Returns the smallest following integer.	<code>ceil (5.9) = 6</code> <code>ceil (growth rate)</code>
cos	Returns the cosine of an angle (specified in degrees).	<code>cos (63) = 0.45</code> <code>cos (beam angle)</code>
cube	Returns the cube of a number.	<code>cube (3) = 27</code> <code>cube (length)</code>
exp	Returns Euler's number (~2.718) raised to a power.	<code>exp (2) = 7.38905609893</code> <code>exp (growth)</code>
exp2	Returns 2 raised to a power.	<code>exp2 (3) = 8</code> <code>exp2 (growth)</code>
floor	Returns the largest previous integer.	<code>floor (5.1) = 5</code> <code>floor (growth rate)</code>
ln	Returns the natural logarithm.	<code>ln (7.38905609893) = 2</code> <code>ln (distance)</code>
log10	Returns the logarithm with base 10.	<code>log10 (100) = 2</code> <code>log10 (volume)</code>
log2	Returns the logarithm with base 2 (binary logarithm).	<code>log2 (32) = 5</code> <code>log2 (volume)</code>
mod	Returns the remainder of first number divided by the second number.	<code>mod (8, 3) = 2</code> <code>mod (revenue, quantity)</code>

Function	Description	Examples
pow	Returns the first number raised to the power of the second number.	<code>pow (5, 2) = 25</code> <code>pow (width, 2)</code>
random	Returns a random number between 0 and 1.	<code>random () = .457718</code> <code>random ()</code>
round	Returns the first number rounded to the second number (the default is 1).	<code>round (35.65, 10) = 40</code> <code>round (battingavg, 100)</code> <code>round (48.67, .1) = 48.7</code>
safe_divide	Returns the result of dividing the first number by the second. If the second number is 0, returns 0 instead of NaN (not a number).	<code>safe_divide (12, 0) = 0</code> <code>safe_divide (total_cost, units)</code>
sign	Returns +1 if the number is greater than zero, -1 if less than zero, 0 if zero.	<code>sign (-250) = -1</code> <code>sign (growth_rate)</code>
sin	Returns the sine of an angle (specified in degrees).	<code>sin (35) = 0.57</code> <code>sin (beam_angle)</code>
spherical_distance	Returns the distance in km between two points on Earth.	<code>spherical_distance (37.465191, -122.153617, 37.421962, -122.142174) = 4,961.96</code> <code>spherical_distance (start_latitude, start_longitude, start_latitude, start_longitude)</code>
sq	Returns the square of a numeric value.	<code>sq (9) = 81</code> <code>sq (width)</code>
sqrt	Returns the square root.	<code>sqrt (9) = 3</code> <code>sqrt (area)</code>
tan	Returns the tangent of an angle (specified in degrees).	<code>tan (35) = 0.7</code> <code>tan (beam_angle)</code>

Text functions

Function	Description	Examples
concat	Returns two or more values as a concatenated text string. Use single quotes around each literal string, not double quotes.	<code>concat ('hay' , 'stack') = 'haystack'</code> <code>concat (title, ' ', first_name , ' ', last_name)</code>
contains	Returns true if the first string contains the second string, otherwise returns false.	<code>contains ('broomstick', 'room') = true</code> <code>contains (product, 'trial version')</code>
edit_distance	Accepts two text strings. Returns the edit distance (minimum number of operations required to transform one string into the other) as an integer. Works with strings under 1023 characters.	<code>edit_distance ('attorney', 'atty') = 4</code> <code>edit_distance (color, 'red')</code>
edit_distance_with_cap	Accepts two text strings and an integer to specify the upper limit cap for the edit distance (minimum number of operations required to transform one string into the other). If the edit distance is less than or equal to the specified cap, returns the edit distance. If it is higher than the cap, returns the cap plus 1. Works with strings under 1023 characters.	<code>edit_distance_with_cap ('pokemon go', 'minecraft pixelmon', 3) = 4</code> <code>edit_distance_with_cap (event, 'burning man', 3)</code>
similar_to	Accepts a document text string and a search text string. Returns true if relevance score (0-100) of the search string with respect to the document is greater than or equal to 20. Relevance is based on edit distance, number of words in the query, and length of words in the query which are present in the document.	<code>similar_to ('hello world', 'hello swirl') = true</code> <code>similar_to (current team, drafted by)</code>

Function	Description	Examples
similarity	Accepts a document text string and a search text string. Returns the relevance score (0-100) of the search string with respect to the document. Relevance is based on edit distance, number of words in the query, and length of words in the query which are present in the document. If the two strings are an exact match, returns 100.	similarity ('where is the burning man concert', 'burning man') = 46 similarity (tweet1, tweet2)
spells_like	Accepts two text strings. Returns true if they are spelled similarly and false if they are not. Works with strings under 1023 characters.	spells_like ('thouhgtspot', 'thoughtspot') = true spells_like (studio, distributor)
strlen	Returns the length of the text.	strlen ('smith') = 5 strlen (lastname)
strpos	Returns the numeric position (starting from 0) of the first occurrence of the second string in the first string, or -1 if not found.	strpos ('haystack_with_needles', 'needle') = 14 strpos (complaint, 'lawyer')
substr	Returns the portion of the given string, beginning at the location specified (starting from 0), and of the given length.	substr ('persnickety', 3, 7) = snicket substr (lastname, 0, 5)

Connections passthrough functions

Note: The following passthrough functions are only supported with Snowflake connections at this time.

Function	Description	Examples
<code>sql_bool_aggregate_op</code>	Returns the boolean data type. The first argument takes the signature of the external function to be executed against the data-source. Subsequent arguments take the values to be passed to the external function.	<ul style="list-style-type: none"> <code>sql_bool_aggregate_op ("booland_agg ({0})", is_delivered)</code>
<code>sql_bool_op</code>	Returns the boolean data type. The first argument takes the signature of the external function to be executed against the data-source. Subsequent arguments take the values to be passed to the external function.	<ul style="list-style-type: none"> <code>sql_bool_op ("is_decimal ({0})", itemCount)</code> <code>sql_bool_op ("is_decimal ({0})", itemCount)sql_bool_op ("boolor ({0}, {1})", 2, 0) = True</code>

Function	Description	Examples
<code>sql_date_aggregate_op</code>	Returns the date data type. The first argument takes the signature of the external function to be executed against the data-source. Subsequent arguments take the values to be passed to the external function.	<ul style="list-style-type: none"> <code>sql_date_aggregate_op ("max ({0})", order_date)</code>
<code>sql_date_op</code>	Returns the date data type. The first argument takes the signature of the external function to be executed against the data-source. Subsequent arguments take the values to be passed to the external function.	<ul style="list-style-type: none"> <code>sql_date_op ("previous_day ({0})", ship_date)</code>

Function	Description	Examples
<code>sql_date_time_aggregate_op</code>	Returns the timestamp data type. The first argument takes the signature of the external function to be executed against the data-source. Subsequent arguments take the values to be passed to the external function.	<ul style="list-style-type: none"> <code>sql_date_time_aggregate_op ("max ({0})", delivery_time)</code>
<code>sql_date_time_op</code>	Returns the timestamp data type. The first argument takes the signature of the external function to be executed against the data-source. Subsequent arguments take the values to be passed to the external function.	<ul style="list-style-type: none"> <code>sql_date_time_op ("timestamp_sub ({0}, {1})", sale_time , 'INTERVAL 30 MINUTE')</code>

Function	Description	Examples
<code>sql_double_aggregate_op</code>	Returns the double data type. The first argument takes the signature of the external function to be executed against the data-source. Subsequent arguments take the values to be passed to the external function.	<ul style="list-style-type: none"> <code>sql_double_aggregate_op ("approx_percentile ({0}, {1})" , unrealised_gain , 0.99)</code>
<code>sql_double_op</code>	Returns the double data type. The first argument takes the signature of the external function to be executed against the data-source. Subsequent arguments take the values to be passed to the external function.	<ul style="list-style-type: none"> <code>sql_double_op ("acosh ({0})" , quantity)</code> <code>sql_double_op ("radians ({0})" , 180) = 3.141592654</code>

Function	Description	Examples
<code>sql_int_aggregate_op</code>	Returns the int data type. The first argument takes the signature of the external function to be executed against the data-source. Subsequent arguments take the values to be passed to the external function.	<ul style="list-style-type: none"> <code>sql_int_aggregate_op ("approx_count_distinct ({0})", sale_volume)</code> <code>sql_int_aggregate_op ("bitand_agg({0}) OVER ([partition by {1}])", user_permissions , user_type)</code>
<code>sql_int_op</code>	Returns the int data type. The first argument takes the signature of the external function to be executed against the data-source. Subsequent arguments take the values to be passed to the external function.	<ul style="list-style-type: none"> <code>sql_int_op ("ceil ({0})", itemCount)</code> <code>sql_int_op ("charindex ({0}, {1})", "qwerty" , "rty") = 4</code>

Function	Description	Examples
<code>sql_string_aggregate_op</code>	Returns the timestamp data type. The first argument takes the signature of the external function to be executed against the data-source. Subsequent arguments take the values to be passed to the external function.	<ul style="list-style-type: none"> <code>sql_string_aggregate_op ("min ({0})" , user-name)</code>
<code>sql_string_op</code>	Returns the string data type. The first argument takes the signature of the external function to be executed against the data-source. Subsequent arguments take the values to be passed to the external function.	<ul style="list-style-type: none"> <code>sql_string_op ("soundex ({0})" , "Marks")</code>

Function	Description	Examples
<code>sql_time_aggregate_op</code>	Returns the time data type. The first argument takes the signature of the external function to be executed against the data-source. Subsequent arguments take the values to be passed to the external function.	<ul style="list-style-type: none"> <code>sql_time_aggregate_op ("max (time ({0}))" , delivery_time)</code>
<code>sql_time_op</code>	Returns the time data type. The first argument takes the signature of the external function to be executed against the data-source. Subsequent arguments take the values to be passed to the external function.	<ul style="list-style-type: none"> <code>sql_time_op ("time_from_parts ({0}, {1}, {2})" , 12 , 30 , 20) = 12:30:20</code>

Alerts code reference

Summary: Learn about the alerts ThoughtSpot may generate.

This reference identifies the messages that can appear in the **System Health > Overview > Critical Alerts** and in the **Alerts** dashboard.

Informational alerts

TASK_TERMINATED

Msg: Task {{.Service}}.{{.Task}} terminated on machine {{.Machine}}

Type: INFO

This alert is raised when a task terminates.

DISK_ERROR

Msg: Machine {{.Machine}} has disk errors

Type: INFO

Raised when a machine has disk errors.

ZK_AVG_LATENCY

Msg: Average Zookeeper latency is more than {{.Num}} msec

Type: INFO

Raised when average Zookeeper latency is above a threshold.

ZK_MAX_LATENCY

Msg: Max Zookeeper latency is more than {{.Num}} msec

Type: INFO

Raised when max Zookeeper latency is above a threshold.

ZK_MIN_LATENCY

Msg: Min Zookeeper latency is more than {{.Num}} msec

Type: INFO

Raised when min Zookeeper latency is above a threshold.

ZK_OUTSTANDING_REQUESTS

Msg: Number of outstanding Zookeeper requests exceeds {{.Num}}

Type: INFO

Raised when there are too many outstanding Zookeeper requests.

ZK_NUM_WATCHERS

Msg: Number of Zookeeper watchers exceeds {{.Num}}

Type: INFO

Raised when there are too many Zookeeper watchers.

MASTER_ELECTION

Msg: {{.Machine}} elected as Orion Master

Type: INFO

Raised when a new Orion Master is elected.

PERIODIC_BACKUP

Msg: {{.Process}} periodic backup for policy {{.Name}} failed.

Type: INFO

Raised when periodic backup fails.

PERIODIC_SNAPSHOT

Msg: {{.Process}} periodic snapshot {{.Name}} failed.

Type: INFO

Raised when a periodic snapshot fails.

HDFS_CORRUPTION

Msg: HDFS root directory is in a corrupted state.

Type: INFO

Raised when HDFS root directory is corrupted.

APPLICATION_INVALID_STATE

Msg: {{.Service}}.{{.Task}} on {{.Machine}} at location {{.Location}}

Type: INFO

Raised when Application raises invalid state alert.

UPDATE_START

Msg: Starting update of ThoughtSpot cluster {{.Cluster}}

Type: INFO

Raised when update starts.

UPDATE_END

Msg: Finished update of ThoughtSpot cluster {{.Cluster}} to release {{.Release}}

Type: INFO

Raised when update completes.

Errors

TIMELY_JOB_RUN_ERROR

Msg: Job run {{.Message}}

Type: ERROR

Raised when a job run fails.

TIMELY_ERROR

Msg: Job manager {{.Message}}

Type: ERROR

Raised when a job manager runs into an inconsistent state.

Warnings

DISK_SPACE

Msg: Machine {{.Machine}} has less than {{.Perc}}% disk space free

Type: WARNING

Raised when a disk is low on available disk space. Valid only in the 3.2 version of ThoughtSpot.

ROOT_DISK_SPACE

Msg: Machine {{.Machine}} has less than {{.Perc}}% disk space free on root partition

Type: WARNING

Raised when a machine is low on available disk space on root partition.

BOOT_DISK_SPACE

Msg: Machine {{.Machine}} has less than {{.Perc}}% disk space free on boot partition

Type: WARNING

Raised when a machine is low on available disk space on boot partition.

UPDATE_DISK_SPACE

Msg: Machine {{.Machine}} has less than {{.Perc}}% disk space free on update partition

Type: WARNING

Raised when a machine is low on available disk space on update partition.

EXPORT_DISK_SPACE

Msg: Machine {{.Machine}} has less than {{.Perc}}% disk space free on export partition

Type: WARNING

Raised when a machine is low on available disk space on export partition.

HDFS_NAMENODE_DISK_SPACE

Msg: Machine {{.Machine}} has less than {{.Perc}}% disk space free on HDFS namenode drive

Type: WARNING

Raised when a machine is low on available disk space on HDFS namenode drive.

MEMORY

Msg: Machine {{.Machine}} has less than {{.Perc}}% memory free

Type: WARNING

Raised when a machine is low on free memory.

OS_USERS

Msg: Machine {{.Machine}} has more than {{.Num}} logged in users

Type: WARNING

Raised when a machine has too many users logged in.

OS_PROCS

Msg: Machine {{.Machine}} has more than {{.Num}} processes

Type: WARNING

Raised when a machine has more too many processes.

SSH

Msg: Machine {{.Machine}} doesn't have an active SSH server

Type: WARNING

Raised when a machine has more than 600 processes.

DISK_ERROR_EXTERNAL

Msg: Machine {{.Machine}} has disk errors

Type: WARNING

Raised when more than 2 disk errors happen in a day.

ZK_FD_COUNT

Msg: Zookeeper has more than {{.Num}} open file descriptors

Type: WARNING

Raised when there are too many open Zookeeper files.

ZK_EPHEMERAL_COUNT

Msg: Zookeeper has more than {{.Num}} ephemeral files

Type: WARNING

Raised when there are too many Zookeeper ephemeral files.

HOST_DOWN

Msg: {{.Machine}} is down

Type: WARNING

Raised when a host is down.

TASK_UNREACHABLE

Msg: {{.ServiceDesc}} on {{.Machine}} is unreachable over HTTP

Type: WARNING

Raised when a task is unreachable over HTTP.

TASK_NOT_RUNNING

Msg: {{.ServiceDesc}} is not running

Type: WARNING

Raised when a service task is not running on any machine in the cluster.

Critical alerts

TASK_FLAPPING

Msg: Task {{.Service}}.{{.Task}} terminated {{._actual_num_occurrences}} times in last {{._earliest_duration_str}}

Type: CRITICAL

This alert is raised when a task is crashing repeatedly. The service is evaluated across the whole cluster. So, if a service crashes 5 times in a day across all nodes in the cluster, this alert is generated.

OREO_TERMINATED

Msg: Oreo terminated on machine {{.Machine}}

Type: CRITICAL

This alert is raised when the Oreo daemon on a machine terminates due to an error. This typically happens due to an error accessing Zookeeper, HDFS, or a hardware issue.

HDFS_DISK_SPACE

Msg: HDFS has less than {{.Perc}}% space free

Type: CRITICAL

Raised when a HDFS cluster is low on total available disk space.

ZK_INACCESSIBLE

Msg: Zookeeper is not accessible

Type: CRITICAL

Raised when Zookeeper is inaccessible.

PERIODIC_BACKUP_FLAPPING

Msg: Periodic backup failed {{._actual_num_occurrences}} times in last {{._earliest_duration_str}}

Type: CRITICAL

This alert is raised when a periodic backup failed repeatedly.

PERIODIC_SNAPSHOT_FLAPPING

Msg: Periodic snapshot failed {{._actual_num_occurrences}} times in last {{._earliest_duration_str}}

Type: CRITICAL

This alert is raised when periodic snapshot failed repeatedly.

APPLICATION_INVALID_STATE_EXTERNAL

Msg: {{.Service}}.{{.Task}} on {{.Machine}} at location {{.Location}}

Type: CRITICAL

Raised when Application raises invalid state alert.

User action code reference

Summary: This reference identifies the user action codes that can appear in System Health and in logs or other reports.

answer_unsaved	User makes a change to tokens in the search bar.
answer_saved	User opens an existing saved answer and makes changes to tokens in the search bar.
answer_pinboard_context	User opens an existing saved Liveboard, edits a context viz and makes a change to tokens in the search bar.
answer_aggregated_worksheet	User opens an existing saved aggregated worksheet and makes changes to tokens in the search bar.
answer_upgrade	Requests made for the sole purpose of upgrade.
pinboard_view	User opens an existing saved Liveboard.
pinboard_filter	User adds, removes or applies values to a Liveboard filter.
pinboard_ad_hoc	User drills down in a Liveboard viz.
data_chart_config	Request for new data being generated following a chart config change.
data_show_underlying_row	Request to show underlying data for a data row(s).
data_export	Request to export data.
pinboard_tspublic_runtime_filter	Request to TSPublic/pinboarddata with runtime filters.
answer_aggregated_worksheet_save	User updates aggregated worksheet.
answer_add_new_filter	User adds a filter using the UI.
data_show_underlying_viz	Request to show underlying data for a data row(s).
answer_view	User opens an existing, saved answer.

answer_viz_context_view	User opens an existing saved Liveboard, edits a context viz.
pinboard_insight_view	User opens SpotIQ tab Liveboards.
pinboard_admin_view	User opens admin tab Liveboards.
pinboard_embed_view	User opens embed Liveboard from a URL.
pinboard_homepage_view	On loading of homepage Liveboard.
pinboard_learn_view	On loading learn Liveboard.
pinboard_tspublic_no_runtime_filter	Request to TSPublic/pinboard data without run-time filters.

Geo Map Reference

Summary: ThoughtSpot recognizes and supports a broad list of geographic regions and their subdivisions.

This reference lists supported countries and their subdivisions. ThoughtSpot renders these regions in geo maps.

You may have to make changes to your data to support geo maps. For example, you may be collecting data for locations in Washington County, Alabama, and also for locations in Washington County, Wisconsin. According to the 2010 Census, there are 31 distinct Washington Counties in the United States.

To account for multiple different geographical entities with the same name, you must be specific within your data. A value of *Washington County* without a state attached to it may result in incorrect or incomplete geo maps.

Download the supported geo maps CSV file

You can download a CSV file containing all the supported values for geo map countries, codes, and subdivisions. Use this file to confirm that your own geographical values are in the right format, and that ThoughtSpot supports them. Download the CSV file [here \[See page 0\]](#).

Note: The CSV file contains leading 0s where these zeros are present for ThoughtSpot at the beginning of zip/post code values. However, if you import this file into Excel or another spreadsheet tool, that tool may remove leading zeros, resulting in data that does not match ThoughtSpot's format.

Supported countries and codes

ThoughtSpot supports mapping of the following countries without subdivisions. To view the countries with associated subdivisions that ThoughtSpot supports, refer to [Supported countries and subdivisions \[See page 76\]](#).

•**Supported countries and codes**

Administration Name	Name	NAME LONG	ISO A3
Aruba	Aruba	Aruba	ABW
Afghanistan	Afghanistan	Afghanistan	AFG
Angola	Angola	Angola	AGO

Public REST API reference

Summary: ThoughtSpot provides several REST APIs to manage users, sessions, ThoughtSpot data objects.

ThoughtSpot REST APIs let you programmatically manage users, user sessions, group privileges, and metadata objects.

For an up-to-date list of API categories and associated resource endpoints, see [REST API reference](https://developers.thoughtspot.com/docs/?pageid=rest-api-reference) (<https://developers.thoughtspot.com/docs/?pageid=rest-api-reference>).

Glossary

Summary: ThoughtSpot has its own company-specific terminology, which is useful to know.

Answer: An answer is the result of search that the user saves in the form of a visualization, such as a table or a chart.

authentication: The process of verifying user credentials, and letting them log into ThoughtSpot.

data set, dataset: A collection of related sets of information that is composed of separate elements, but can be manipulated as a unit by a computer. In the case of tabular data, a data set is comprised of one or more database tables, where every column of a table represents a specific variable, and each row corresponds to a record of the data set.

filter: This is a column value that a user can add to search.

formula: This is an expression that applies a calculation, usually a mathematical calculation, to data.

group aggregation: This enables you to aggregate a value by a specific attribute. Also known as *pinned aggregation* or a *level-based measure*.

impression: An impression registers when a user enters text into a search bar, or loads a *Liveboard*.

Liveboard: This is a collection of related *answers*, or search results, that appear as tables or visualizations.

pinned measure: This enables you to aggregate a value by a specific attribute. Also known as *group aggregation*, or a *level-based measure*.

reportbook: This is an internal name for a *visualization*.

search: This is a query in ThoughtSpot. We call this search because ThoughtSpot queries enable the user to find business information as efficiently as using an Internet search engine.

token: The text that users enter in the search bar. This includes keywords, column names, and formula names.

user : Individuals that can log in to ThoughtSpot. See *authentication*.

visualization : This is a visual representation of data. In ThoughtSpot, it is the representation of an *answer*. In some cases, we use the terms *visualization* and *answer* interchangeably.

viz : This is a common abbreviation for *visualization*.

Frequently asked questions

Where can I find the version of ThoughtSpot I am using?

Users with administrative privileges can see this displayed on the **Admin > System Health > Overview** page.

I'm not seeing certain columns/values in the drop-down, why?

It could be the index has not built with the latest data or something is causing the column to be dropped.

- Verify the the column is available using the **Data** page.
- View the table columns and check the **INDEX TYPE** value. If it is set to `DONT_INDEX` , change it.
- Check the column's **INDEX PRIORITY**. Make sure it is `1` .

To learn more about modeling data see [modeling data \[See page 0\]](#) in this documentation.
